Employee check-in Initials

I am aware of the risks and understand the information presented in this anesthesia and surgical consent form. I give the hospital and its staff members permission to proceed with the surgery and to perform any and all life-saving procedures should the need arise. **I understand that I am expected to pay for all services rendered at the time my pet is discharged.** I also understand that a deposit may be required.

PART I – MEDICAL HISTORY

The medical history we review with you is a relevant part of surgical preparation. It is important to us that we provide the best care for your pet pre-surgically, surgically and post surgically. The medical history review helps the doctor to decide what kind of anesthesia to use, whether or not an IV catheter and fluid therapy will be required, and what type of aftercare your pet is going to need. It is also a determining factor as to whether or not your pet is healthy enough to endure surgery. Please plan on spending a few minutes with the technician so that she can review all these details with you. Surgical check in time is between 8:00 a.m. & 9:00 a.m.

PART II – VACCINATIONS/PARASITE CONTROL/MICROCHIP

In order to keep your pet safe, we require that surgical patients be up to date on their DHPPC/FVRCP, Rabies and Bordetella vaccines. These vaccinations protect your pet, as well as the other pets that are in our facility. They help control viruses that are airborne and/or transferred by bodily fluids. We also want to protect your pet from both external and internal parasites. Heartworm and flea/tick control products help to ensure that your pet is parasite free which makes for a healthier, happier pet. We also like to discuss microchipping when coming for surgery. The most comfortable time to have a microchip embedded in your pet is while he/she is asleep. It only takes seconds, and is guaranteed for a lifetime. The first question we ask anyone that has lost a pet is “Is your pet microchipped?”. There is a greater probability of your pet being found and returned to you if it is microchipped. We can microchip your pet today for only \$49.99. This includes the first year’s registration. If your pet already has a microchip, we would be happy to scan him/her to make sure that the microchip can still be read, just ask us!

PART III – SURGICAL OPTIONS

We have many surgical options that you can choose to have done on your pet at the time of surgery. Certain procedures require a surgical laser, with other procedures the surgical laser is an option. There are four main differences between laser and conventional surgery. Laser surgery benefits include the following: less pain and swelling, promotes a quicker recovery; less bleeding simplifies surgery; less trauma for your pet; and the sanitizing effect of the laser beam reduces the risk of infection.

The next surgical option is **pre-operative lab work**. Pre-operative lab work helps to give us an internal picture of the health of your pet. This lab work can be done in house the day of the surgery or, if you would like, we can send the lab work out and get more results for the same cost (level 2 and 3). If you would like to have the lab work sent out, we can make an appointment for a blood draw a couple days in advance of the surgery to guarantee results to be back prior to the surgery date. The doctor may require pre-surgical lab work based on your pet’s age and/or health condition.

Our doctor always advises every client to choose the **IV catheter and fluid therapy** option. This option has saved lives! The basic function of the IV catheter and fluid therapy is to help maintain blood pressure, keep the pet hydrated during surgery which helps the pet eliminate anesthetics quicker, and in an emergency situation, provides the doctor with an available port to inject life saving medications if necessary.

Our **comprehensive safety package** is a combination of pre-surgical lab work, an IV catheter, and a microchip. The cost of the safety packages depends on the age/health of your pet. Please remember to make a pre-surgical lab work appointment a couple days prior to surgery if your pet has health problems or is 4 years of age or older.

Laser Therapy, our second option, helps to reduce swelling and promote healing. Laser Therapy can be used with either laser surgery or conventional surgery. If you choose this option, we will provide your pet with two laser therapy treatments. The first laser therapy treatment would be done post surgically the same day and the second treatment would be the following day prior to discharge.

There are several additional surgical options listed on the front of this form. Some of these procedures can be done with or without anesthesia, however, it is more comfortable and we can be more effective while your pet is asleep.

PLEASE MAKE SURE YOU ASK QUESTIONS IF YOU HAVE ANY. WE ARE HERE FOR YOU AND YOUR PET’S NEEDS!
